Financial Performance Dashboard – Summary

1. Project Objective

The objective of this dashboard is to analyze financial performance across regions and product/services. It provides insights into revenue trends, profitability, budget performance, receivables aging, and cash flow. The dashboard enables users to monitor financial metrics and compare actual performance with planned targets.

---

2. Logic Used

The dashboard calculations and analysis were based on the following logic:

- Revenue Analysis: Total Revenue was aggregated to measure overall business performance.
- Gross Margin % Calculation:
  Gross Margin % = (Gross Profit ÷ Revenue) × 100
- EBITDA % Calculation:
  EBITDA % = (EBITDA ÷ Revenue) × 100
- Net Cash Calculation:
  Net Cash = Cash Inflows – Cash Outflows
- Budget Variance %:
  Measures the percentage difference between Actual Revenue and Budgeted Revenue.
- Receivables Aging Buckets:
  Receivables were categorized into aging groups (0–30, 31–60, 61–90, 90+ days) to analyze outstanding payments.

These calculations help evaluate profitability, financial health, and operational efficiency.

---

3. Key Insights from the Dashboard

Some important insights that can be derived from the dashboard include:

- Revenue and Gross Profit trends show how financial performance changes across different time periods.
- Budget vs Actual variance helps identify whether revenue targets are being met.
- Product/Service performance highlights which categories contribute the most to revenue.
- Receivables aging analysis helps identify delayed payments and potential collection risks.
- Cash flow analysis shows the monthly movement of net cash and overall liquidity position.

---

4. Interactivity and Analysis Features

The dashboard includes several interactive features to improve analysis:

- Region Filter to analyze performance by geographical region.
- Product/Service Filter to compare revenue contribution across categories.
- Year Filter for time-period selection.
- Drill-down functionality in the trend chart to analyze data from Year → Quarter → Month.

These features allow users to explore the data dynamically and perform deeper analysis.

---

5. Data Accuracy Validation

To ensure the reliability of the data, validation checks were performed on key financial calculations.

- Gross Profit Validation:
  Revenue – COGS = Gross Profit
- EBITDA Validation:
  Gross Profit – Opex = EBITDA

Both validation checks returned 0.00, confirming that the dataset calculations are accurate and there are no discrepancies in the financial data.

---

6. Assumptions

The following assumptions were considered while creating the dashboard:

- All financial figures are assumed to be recorded in the same currency.
- Revenue Budget values represent planned revenue targets.
- Receivables Aging represents the number of days invoices remain unpaid.
- The Month column represents the reporting period used for time-based analysis.
